

AbleSpace Take Data Workflow

Walkthrough & UX Review

Part 2: Product Understanding | Shreyash Londhe

Overview

AbleSpace is a case-management and progress-monitoring platform built for special education teams. It tracks IEP goals, service minutes, accommodations, and day-to-day data collection for individual students. This document walks through the “Take Data” flow starting from the Caseload tab, covers every screen and modal I interacted with along the way, and closes with the UX/UI and functionality changes I'd suggest.

I worked through the flow live using the Demo Student1 account from the provided session link, rather than describing it from static screens alone.

Quick Reference

Screen / Action	What it's for
Caseload → Take Data	Entry point that opens a live data-collection session for one or more students
Capture tab	Log a data point against the selected goal in real time
Graph tab	Visualize a goal's logged data over time as a trend line
Stats tab	Review the raw history of every session/trial logged for a goal
Info tab	Goal metadata such as measurement type, data point count, and running average
+Add (Goals panel)	Add a goal manually, from an uploaded IEP (AI-extracted), or AI-generated
+Phase	Group a goal's data into phases (e.g. baseline vs. intervention)
Customize View	Switch the Goals panel between List, Board, and Group layout
Accommodations	Log which accommodations applied during this session
Services / attendance	Log attendance and service minutes for the session

Workflow Walkthrough

1. Starting from Caseload

Every student on the caseload gets a row with their IEP due date, eval due date, collaborators, weekly service time, and school. A “Take Data” button sits at the end of the row. Clicking it opens a live data-collection session for that student.

Fig. 1: Caseload tab, Take Data entry point

2. Landing on the Capture tab

The session opens on Capture. The header shows the session's date/time window (auto-set to “now,” a 30-minute block), a copy/duplicate icon and a sync icon, and two quick-access buttons for Accommodations and Services Not Tracked, plus an overflow menu. Below that, the current student appears as a chip, with a “+Add Student” option next to it, so a group session can share one data-entry screen across several students instead of forcing a separate session per student.

On the left, “Goals (7/7)” lists every active goal pulled from the student's IEP: Social Studies, Writing, Math, Reading, Toileting, Behavior, and a second Math goal, each shown as a card with its title and a truncated objective. The first Math goal carries a “2 Obj.” badge, meaning it's scored against two objectives rather than one.

Fig. 2: Capture tab, default landing view for a session

3. Adding a goal

The “+Add” button above the goals list opens three ways to create a goal: Add Manually (type the details in yourself), Upload IEP (AI extracts goal details from an uploaded IEP document), or Generate with AI (AbleSpace's AI drafts goals and objectives from scratch). A separate link handles adding several goals at once via a table.

Fig. 3: Add Goals modal, three creation paths

4. Customize View

“Customize View,” top right of the session, toggles how the Goals panel is laid out: List (the default), Board, or Group.

Fig. 4: Customize View options

5. Capturing a data point

Selecting a goal, here “1. Social Studies,” loads its full objective above the capture card: “Demo Student1 will take 5 bites, from a handheld snack, such as a cheese stick in 4 out of 5 opportunities.” The capture control itself is one large “+” button. Each tap increments a running count for the current trial; “Undo” reverses the last tap. It's built for one-handed, fast logging while you're watching the student, not the screen.

Fig. 5: Capture widget after three taps

6. Trials and phases

Above the capture card, “< Trial 1 >” steps between trials within the same session, for goals scored across multiple attempts. The adjacent overflow menu adds Reset Trial and Delete Trial for the trial in view.

Fig. 6: Trial overflow menu

“+Phase” opens a Goal Phases panel for grouping a goal's data into phases (standard terminology for baseline vs. intervention vs. maintenance) with a “+ New” button to create one. This demo goal has no phases set up yet.

Fig. 7: Goal Phases panel, empty state

7. Graph Tab and Trend Data

The Graph tab plots the selected goal's logged values over time as a line chart, with an “All Time” range filter, “Graph Options,” and a further filter icon.

Below the tabs, the Notes panel (open in this screenshot) is a full rich-text editor with an “Ask AI” assist, standard formatting controls, a “Student Note” type dropdown, and a “for [Student]” dropdown so a note gets attributed to the right student when several are in the same session.

Fig. 8: Graph tab, with the Notes editor open

8. Stats tab

Stats is the raw table behind the graph, listing every session/trial entry with its date/time, who logged it (a colored initial), the frequency recorded, and any note attached (long notes truncate with “See more”). “View More Data” paginates further back. “Add Data” lets you manually back-fill an entry outside the live capture flow, and “Download” exports the table. A “Performance Summary” block sits underneath but is locked behind “Unlock with free trial” on this account tier.

The screenshot displays the AbleSpace interface with the Stats tab selected. The main area shows a table of session/trial history for 'Demo Student1' with the following data:

Session/Trial	Edited By	Frequency	Notes
01/01/2023 11:25 AM	S	1	
01/06/2023 12:26 PM	S	2	1. Demo Student1 got angry and was hitting other students today. See more
01/22/2023 12:43 PM	S	3	
02/12/2023 01:23 PM	S	3	

Below the table, the Performance Summary block is visible, but it is locked behind a 'Unlock with free trial' message.

Fig. 9: Stats tab, session/trial history

9. Info tab

Info is the goal's metadata sheet: measurement type (Frequency, here), the date it was last updated, total data points logged (9), and how many notes are attached (1), plus the full goal text and a running average (3.11) under Performance Summary.

Fig. 10: Info tab, goal metadata and average

10. Accommodations

The “Accommodations” button at the top of the session opens a per-student table for logging which accommodation, and which specific option under it, applied during this session.

Fig. 11: Accommodations modal

11. Services / attendance

“Services Not Tracked” opens a similar table for attendance and service time. Attendance defaults to “Not Tracked” until set, and total minutes start at 0 until entered manually or filled via the “Autofill” button.

Fig. 12: Services / attendance modal

What Works Well

- **Fast, thumb-friendly capture.** The tap-to-tally “+” button is large and free of extra chrome, which is exactly right for logging behavior in real time while attention is on the student, not the screen.
- **Group sessions match real classroom workflow.** “+Add Student” lets one session cover several students at once, instead of forcing a restart per student during group instruction.
- **Goal creation covers how the data actually exists.** Manual entry, IEP upload, and AI generation cover the realistic range of how a teacher would already have this information, rather than assuming everyone starts from a blank form.
- **Everything stays on one screen.** Capture, Graph, Stats, and Info as tabs on the same screen mean you never lose your place in the goal list while checking trend data mid-session.

Suggested Improvements

1. **No progress-toward-mastery indicator in the capture widget.** The full objective (“5 bites ... in 4 of 5 opportunities”) is printed above the counter, but the counter itself is a bare number with a “+.” A teacher taking data mid-session has to hold the criteria in their head and do the math themselves. Framing the count against the target, for example “3 of 5” or a small progress ring, would remove that mental step, which matters most when attention is split with the classroom.
2. **Three ways to remove data, with no explanation of which does what.** “Undo” (on the capture card), “Reset Trial,” and “Delete Trial” (both in the overflow menu) sound related but aren’t distinguished anywhere in the UI. Does Undo remove one tap or the whole trial? How does Reset differ from Delete? For a compliance tool where accidental data loss matters, this needs at minimum a tooltip on each.
3. **Trial navigation doesn't show how many trials exist.** “< Trial 1 >” pages between trials but gives no count (“Trial 1 of 3”) and no way to jump directly to one. On a goal scored across several trials, there's no way to tell how far along you are without clicking through each one.
4. **Measurement type isn't visible where data is actually entered.** “Frequency” only appears on the Info tab. Since goals can use different measurement types and you can switch goals from the left panel mid-session, showing the type on the Capture tab too would remove any doubt about what the number being tapped in actually represents.

5. **Notes aren't scoped to a goal.** “Add Note” attaches to the student for the whole session, not to a specific goal or trial. In the Stats tab, a past note about a behavioral incident sat under a Social Studies data row. For documentation that can end up referenced in an IEP meeting, it should be clear whether a note is about the goal being scored or a general session observation, rather than left to whoever is typing it to make explicit.
6. **Core progress metric is paywalled inside the compliance workflow.** “Performance Summary” on the Stats tab is locked behind “Unlock with free trial” even on an account already collecting real data. For a tool whose entire purpose is progress monitoring, gating the average/trend calculation competes with the actual job a teacher is trying to do in that moment.
7. **Accommodations and Services buttons read as disabled.** Both sit at the top of the session in the same low-contrast gray pill style, which visually reads as inactive even though they open functional modals (and Services defaults to “Not Tracked” until filled in). Since service-time logging often ties to billing, it's easy to end a session without touching either and not notice.
8. **No guidance on which goal-creation path to use.** Add Manually, Upload IEP, and Generate with AI are presented as three equal cards. A short recommendation on each, for example “Best if you already have a signed IEP” on Upload IEP, would speed up that decision for a first-time user.

Closing Thoughts

The Take Data flow is well suited to its actual use case: fast, low-friction logging in the middle of a lesson, with trends, history, and service tracking all reachable without leaving the screen. Most of what I'd change is about closing small information gaps, like what a number means or what an action actually does, rather than restructuring anything.
